VICTOR THORNE San Francisco, CA | v.thorne@apex.ai | +1 (555) 010-9988 Portfolio: github.com/v-thorne | LinkedIn: linkedin.com/in/victor-thorne-architect PROFESSIONAL SUMMARY Strategic AI Solutions Architect with 10+ years of experience engineering autonomous systems and distributed cloud architectures. Expert in bridging Large Language Model (LLM) reasoning with production-grade enterprise pipelines. Proven track record in reducing operational costs and accelerating time-to-market for AI-driven products. TECHNICAL ARSENAL AI & Intelligence: GPT-4, Claude 3.5, Agentic RAG, Neural Orchestration, LangGraph, Prompt Engineering. Infrastructure & DevOps: Kubernetes, AWS (Lambda, SageMaker, S3), Docker, Terraform, CI/CD, Microservices. Software Development: Python (Expert), Rust, Go, TypeScript, FastAPI, Node.js, React. Data Systems: PostgreSQL, Pinecone (Vector DB), Redis, Apache Kafka, GraphQL, MongoDB. PROFESSIONAL EXPERIENCE Apex Neural Systems | Director of AI Engineering San Francisco, CA | 2022 – Prese
comapany name and role*

ASE in TCS

Output

Here is the percentage of you likely getting hired :## 📊 ATS Analysis Report: **ASE (Assistant System Engineer)** @ **TCS** ### 1) Technical Stack Match (50%) **Resume signals found (strong):** - **Programming:** Python (Expert), Go, Rust, TypeScript, Node.js - **Backend/Frameworks:** FastAPI, Microservices, GraphQL - **Cloud/DevOps:** AWS (Lambda, SageMaker, S3), Docker, Kubernetes, Terraform, CI/CD - **Data/Streaming:** PostgreSQL, MongoDB, Redis, Kafka - **AI (bonus, not always required for ASE):** GPT-4, Claude, RAG, LangGraph, Prompt Engineering **Typical ASE @ TCS expectations (broad baseline):** - Strong fundamentals in **coding + CS basics**, usually **Java/Python/.NET**, OOP, DSA - Basic exposure to **SQL**, APIs, SDLC, Git, testing - For cloud tracks: **AWS/Azure**, containers, CI/CD are positives **Match assessment:** - Your stack is **above-average** for ASE (you exceed baseline via cloud + microservices + data systems). - Potential mismatch: if the ASE role is **Java-heavy** or **.NET/SAP-specific**, your resume doesn't show Java/.NET/SAP. **Technical Stack Match Score:** **43/50** --- ### 2) Keyword Density & Formatting (20%) **ATS-positive formatting:** - Clear sections: Summary, Skills ("Technical Arsenal"), Experience - Uses dense skill keywords (good for parsing) - Includes links + location + contact details **ATS risks / gaps:** - Experience section is **incomplete/truncated** ("2022 – Prese…"). ATS may treat this as incomplete employment history. - Limited visible role bullets/accomplishments due to truncation → reduces keyword anchoring (SDLC, Agile, unit testing, Git, Jira, OOP, DSA, etc.). - ASE roles often filter on keywords like **Java, OOP, DSA, SDLC, Agile, Git, REST**—not clearly represented in the provided excerpt. **Keyword Density & Formatting Score:** **11/20** --- ###

3) Role-Specific Experience (30%) **Strengths for ASE:** - 10+ years engineering experience (suggests strong delivery capability) - Director-level ownership of architecture, distributed systems, and production pipelines **Concerns for ASE alignment (role-level fit):** - **ASE is entry-to-early career** in many TCS tracks; your profile reads **senior/architect/director**. - Recruiters may flag as **overqualified** or **compensation/level mismatch**, unless the ASE track is being used broadly or you're explicitly targeting a lower band. - Missing explicit day-to-day ASE signals in the excerpt: **Agile ceremonies, ticket-based delivery, unit testing, code reviews, Git workflow, client delivery**, etc. **Role-Specific Experience Score:** **15/30** --- ## ✅ Final Verdict: **69%** **Current Status:** **Less Chances**

Output

development needed : Quick clarification before I proceed: do you want this resume optimized for an ASE (Associate Systems Engineer) role at TCS specifically, or do you want it optimized for senior/architect roles (e.g., Director / AI Solutions Architect)? The guidance and edits differ a lot depending on which target you want. If you confirm, I will produce a tailored, ATS-friendly resume and a checklist of missing skills to address. Meanwhile, based on the info you provided, here's an immediate skills inventory, gaps for an ASE role at TCS, and concrete resume optimization suggestions you can use right away. 1) Skills you already have (strengths) - AI / LLMs / agentic systems: GPT-4, Claude 3.5, Agentic RAG, neural orchestration, prompt engineering — strong domain expertise. - ML infra & model ops: SageMaker, neural orchestration, Vector DB (Pinecone), RAG. - Cloud & infra: AWS (Lambda, S3, SageMaker), Kubernetes, Docker, Terraform, CI/CD. - Distributed systems / messaging: Apache Kafka, microservices. - Databases & caching: PostgreSQL, Redis, MongoDB. - Software engineering & languages: Python (expert), Rust, Go, TypeScript, Node.js, FastAPI, React — full-stack and systems-level ability. - Dev practices: Microservices, GraphQL, containerization, infra-as-code. - Leadership / product impact: Director-level role suggests hiring, strategy, stakeholder communication, cost/time-to-market impact. 2) Gaps relative to a typical ASE (Associate Systems Engineer) role at TCS (If TCS ASE is your target — these are commonly expected) - Java / J2EE / Spring: Many TCS roles expect Java as a core language — not present in your list. - Core CS fundamentals emphasized for ASE: data structures & algorithms interview prep, OS fundamentals, networking basics — not explicit. - Enterprise / legacy stack exposure: familiarity with Java enterprise apps, SOAP, mainframe, or SAP could be useful in some TCS projects. - Formal education & certifications: I didn't see education (degree) or certifications (AWS, GCP, Kubernetes, Terraform, etc.) listed — these matter for ASE screening. - Testing & QA tooling: explicit unit testing frameworks, CI pipeline examples, test coverage practices, e2e testing tools. - Linux / shell scripting & basic sysadmin skills: often required for junior production support roles. - Specifics of SDLC & Agile practices (scrum roles, Jira) — not spelled out. - Resume-level tailoring: your current summary and title are senior — for ASE you should emphasize hands-on

implementation and foundational skills rather than strategic leadership. 3) If target is senior/architect/Director roles — potential minor gaps - MLOps scale metrics: more specifics on cost reductions, latency improvements, throughput, model-serving scale, SLO/SLA metrics would strengthen. - Security & compliance: mention IAM, encryption, data governance, privacy if you have experience. - Enterprise vendor experience: experience working with large enterprise procurement, vendor management, or regulated industries (finance, healthcare) can be helpful. - Cross-functional product examples: concrete examples showing productization (e.g., shipped X product, Y users, $ revenue) are helpful. 4) Resume optimization: concrete changes to make (high priority) - Add a short, targeted headline and summary tailored to your target role (ASE vs Architect). I can provide both versions if you confirm the target. - Include an Education section (degree, institution, graduation year). If you don't want to include year, at least list degree and school. - Add Certifications (AWS Certified Solutions Architect/Developer, CKAD/CKA, Terraform Associate, GPT/AI relevant certs) if you have them — if not, consider obtaining 1–2 that match the role. - Expand Professional Experience bullets with metrics and outcomes (quantify cost savings, latency reduction, deployment frequency, team size, budget). - For ASE targeting: shorten leadership language, emphasize hands-on technologies, core coding projects, internship/dev tasks, and algorithms. - For senior targeting: expand on architecture decisions, cross-team programs, roadmaps, and measurable product impacts. - Make Technical Arsenal a compact skills table/sections (Languages, Cloud & Infra, ML & AI, Data & Storage, Dev Tools) so ATS parses keywords easily. - Include a Projects section with 2–3 concise, technical, hands-on examples (code links on GitHub, small demos) — for ASE, add coursework or small projects showing Java, DS/algorithms, and SQL. 5) Sample optimized summary (two variants) - For ASE / TCS (entry-level/early-career): Aspiring Systems Engineer with strong hands-on experience in cloud-native development, containerization (Docker, Kubernetes), and backend engineering using Python and TypeScript. Proven ability to build and deploy microservices, manage PostgreSQL and Redis data stores, and automate CI/CD pipelines with Terraform. Solid foundation in algorithms, SQL, and UNIX — seeking an ASE role to apply engineering fundamentals and cloud skills in enterprise delivery teams. - For Senior / Architect: Strategic AI Solutions Architect with 10+ years building production-grade autonomous systems and distributed cloud architectures. Expert in LLM orchestration (GPT-4/Claude), MLOps (SageMaker, Pinecone), and scalable microservices on Kubernetes and AWS. Track record of reducing operational costs and accelerating time-to-market for AI products through robust infra automation and neural orchestration. Seeking to lead AI infrastructure and platform initiatives at scale. 6) Example optimized technical skills section (concise, ATS-friendly) - Languages: Python (expert), Go, Rust, TypeScript, SQL - ML & LLMs: GPT-4, Claude 3.5, RAG, Pinecone, SageMaker - Cloud & Infra: AWS (Lambda, S3, SageMaker), Kubernetes, Docker, Terraform, CI/CD - Data & Messaging: PostgreSQL, Redis, MongoDB, Apache Kafka - Frameworks & Tools: FastAPI, Node.js, React, Git, GraphQL
